

Nicolas Amatuzio . Jarvis Consulting

I am graduate from Seneca's software development degree program which equipped me with a variety of skills which I've been able to apply in the real world. I have previously worked for the Ontario government (MPBSD) as a developer and DevOps specialist, leveraging my skills in full-stack, python data analytics and navigating cloud computing technologies to find cost-saving strategies or create meaningful solutions across multiple teams. I have a strong background in leadership through my time at Canada Bread, leading a team of 15 individuals when needed and providing key performance metrics to plan ahead for days. I previously developed a microservice in AWS leveraging S3 buckets for storage, EC2 for scalability, cognito for authentication, and docker for deployment. I am an unrelentingly optimistic developer with a proven experience in a broad spectrum of development such as fullstack development and data analysis with a high regard for communication, teamwork, and delivering efficient solutions in collaborative environments.

Skills

Proficient: Java, Python, Javascript, HTML/CSS, Linux/Bash, Microsoft Azure, RDBMS/SQL, Agile/Scrum, Docker, Git, GitHub, Figma, Trello, MongoDB

Competent: CI/CD, Jest, NumPy, Pandas, BeautifulSoup, Typescript, AWS, Google Cloud Platform, Angular

Familiar: C/++, C#, .NET, Burp Suite, Express JS, Handlebars

Jarvis Projects

Project source code: https://github.com/jarviscanada/jarvis_data_eng_NicolasAmatuzio

Cluster Monitor [GitHub]: Developed a monitoring agent to collect VM usage metrics and store it inside of a PSQl database. Utilized persistent databases in order to preserve disk, cpu, and memory information from the user agent for higher level users to manage. Deployed through GitHub and the postgres docker container for the database.

Java Grep App [GitHub]: Developed a simple grep application in java leveraging lambda functions and streams to enable functionalities in a low memory environment. Implemented recursive search for searching entire directories and enabled users to set a custom output directory. Built with Maven, utilized log4j to log errors and debug info, and containerized using docker, with the image being uploaded to docker hub.

Python Data Analytics [GitHub]: Developed a proof of concept for a UK-based wholesaler, London Gift Shop (LGS). Leveraged Jupyter Notebook was used for data exploration, Python libraries such as pandas, numpy, matplotlib for data wrangling and visualization, and leveraging common analytical techniques like RFM to create data insights into customer behaviour.

Highlighted Projects

Fragments Microservice [GitHub]: Developed a microservice allowing users to upload and convert various file types to others using AWS infrastructure. Leveraged web app security protocols for strong user authentication, authorization, and defense against common attacks. Deployed an AWS EC2 instance for the reliability and scalability of final production workloads. Implemented AWS Cognito for user authentication and authorization for secure access control. Wrote comprehensive unit tests in jest to achieve a 95%+ codebase coverage. Wrote a dockerfile to containerize fragments and uploaded the image to docker hub for easy CI/CD integration. Set up a CI/CD pipeline through GitHub actions to run necessary tests and deploy the app on an EC2 instance.

Personal Website [GitHub]: Worked with the WebGL rendering engine 3js to create a vibrant, dynamic background for my website. Created animations that play off a ray cast mouse click to allow users to interact with the background through the 3d objects. Developed interactive components such as a card component for the 'flat' portions of the site to give browsing the site a better feel. Created a secret phrase bar that allows users to edit certain aspects of the site to provide a more fun user experience in allowing users to guess what possible phrases there could be. Developed multiple shaders for objects that can be dynamically updated through the secret phrase bar. Adhered to common web development principles to make the site easier to look at and read, especially on mobile devices

Professional Experiences

DevOps Developer(I&IT), Ministry of Public and Business Service Delivery (MPBSD) (Jan 2023 - Sept 2023): Played multiple roles across DevOps, full-stack, and data engineering in a cross-functional team, helping deliver

multiple high-impact projects that exceeded expectations. Utilized Azure services to create a subscription management system, providing streamlined access to important information directly to managers. Worked with reducing the costs of services and the clutter of unused resources by 10% through flagging unused subscriptions for deletion. Utilized AI models (GPT) with data extraction libraries in Python (pandas, BeautifulSoup, NumPy) to develop a chatbot for faster onboarding by integrating information about systems, operations, and services. Automated data extraction using Azure storage services and Azure Functions to give the chatbot a strong knowledge base and up-to-date information. Created new database operations and CRUD APIS with Azure solutions to support the integration of new services and ensure solid data management. Redesigned charity hockey event website for a sleeker feel, updating the responsiveness of certain React components and updating database operations to include new sponsors. Coordinated a team of 4 at a Microsoft-sponsored hack-a-thon and conducted user research to understand needs and challenges faced by clients, both those who are technically literate and not, winning the category of most improved government operations.

Distribution and Logistics Database Specialist, Canada Bread Company, Limited (Mar 2021 - Apr 2025):

Worked with logistical Oracle SQL systems to provide information to distribution planners such as volume, inventory, and other key performance indicators. Ensured maximum efficiency with the database through rigorous troubleshooting and updates. Worked with management to schedule around target KPIS. Collaborated with higher management to redesign workflows to improve efficiency of the day. Underwent restructuring of workplace, assisted higher management through creating necessary diagrams to visualize changes.

Education

Seneca College (2019 - 2023), Honours Bachelor of Technology - Software Development, School of Computer Programming & Analysis - Scholarship (2019 - 2022) - President's List (2020, 2022) - GPA: 3.9/4.0

Miscellaneous

- Basketball: I sometimes go to the park with my friends on my off time and play basketball, nothing too serious but it's always a fun time and it keeps me active and gives me an activity that I can always improve upon.
- Gunpla / Model Kits: I really enjoy building and customizing model kits. I find it very relaxing and love how much of a time sink it can be in detailing, painting, and making them look as good as possible. I prefer building anything from Digimon, Yu-Gi-Oh, or Armored Core, but honestly if I like the design, I'll build it.
- Competitive gaming: Love fighting games and the complexities that come with learning them. Tekken and Street Fighter are my preferred games.
- Puzzle games: I always enjoy using my brain to think of abstract solutions, which is why I love puzzle games, specifically those that take a simple concept and stretch to be as complex as possible, such as Baba is You, and Manifold Garden.
